

# Software 1

תרגול 9  
Java I/O

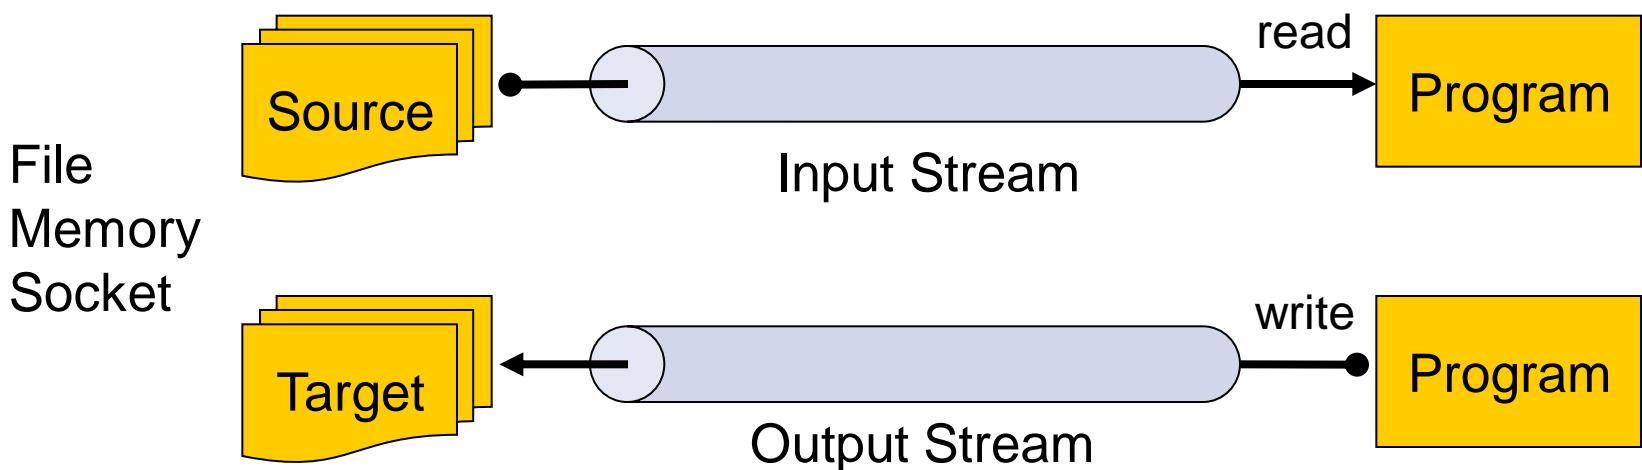

# The `java.io` package

---

- The `java.io` package provides:
  - Classes for reading input
  - Classes for writing output
  - Classes for manipulating files
  - Classes for serializing objects

# Streams

- A **stream** is a sequential flow of data
- Streams are one-way streets.
  - ***Input streams*** are for reading
  - ***Output streams*** are for writing

# Streams

- Usage Flow:

- open a stream**

- while more information**

- Read/write information**

- close the stream**

- All streams are automatically opened when created.

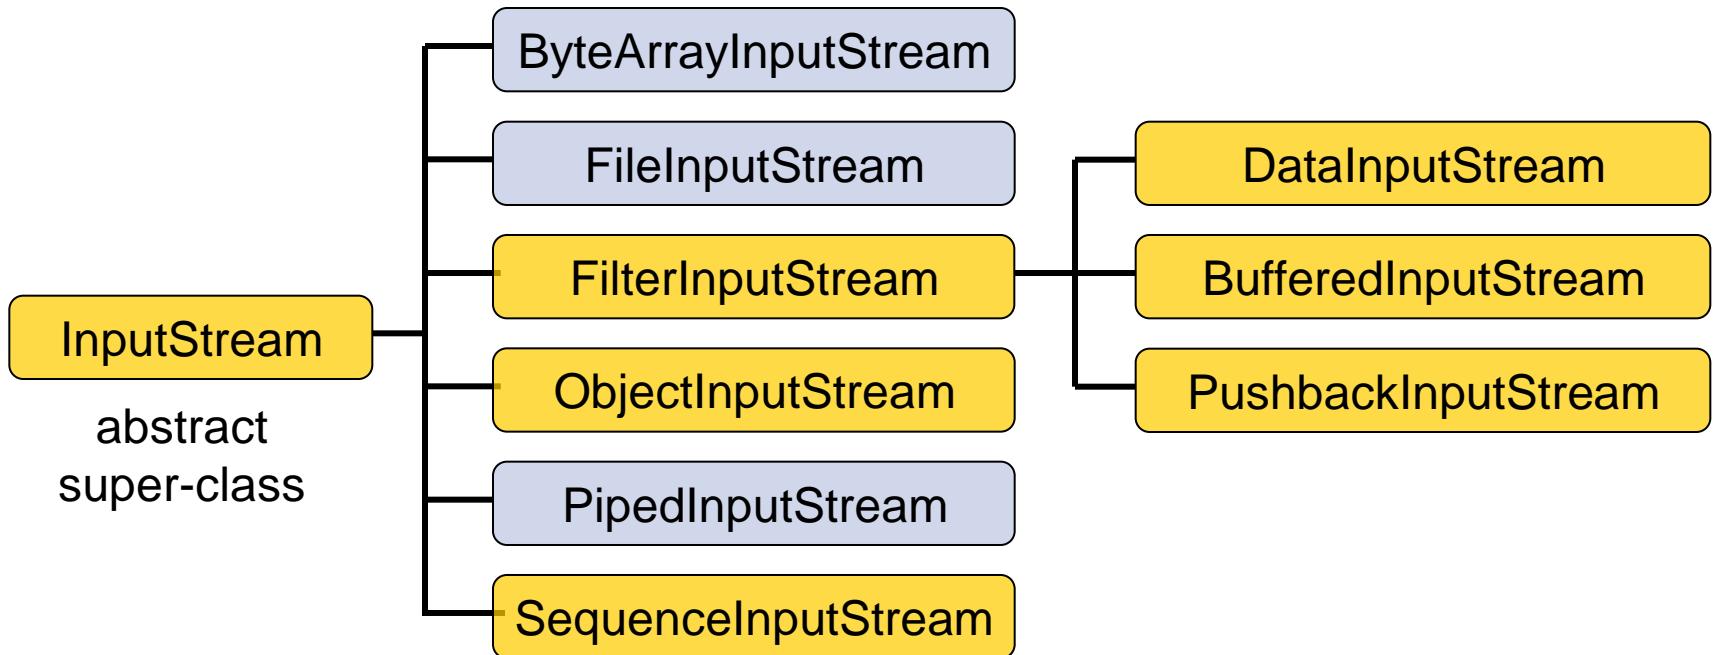

# Streams

- There are two types of streams:
  - ***Byte streams*** for reading/writing raw bytes
  - ***Character streams*** for reading/writing text

## ■ Class Name Suffix Convention:

	Byte	Character
Input	InputStream	Reader
Output	OutputStream	Writer

# InputStreams

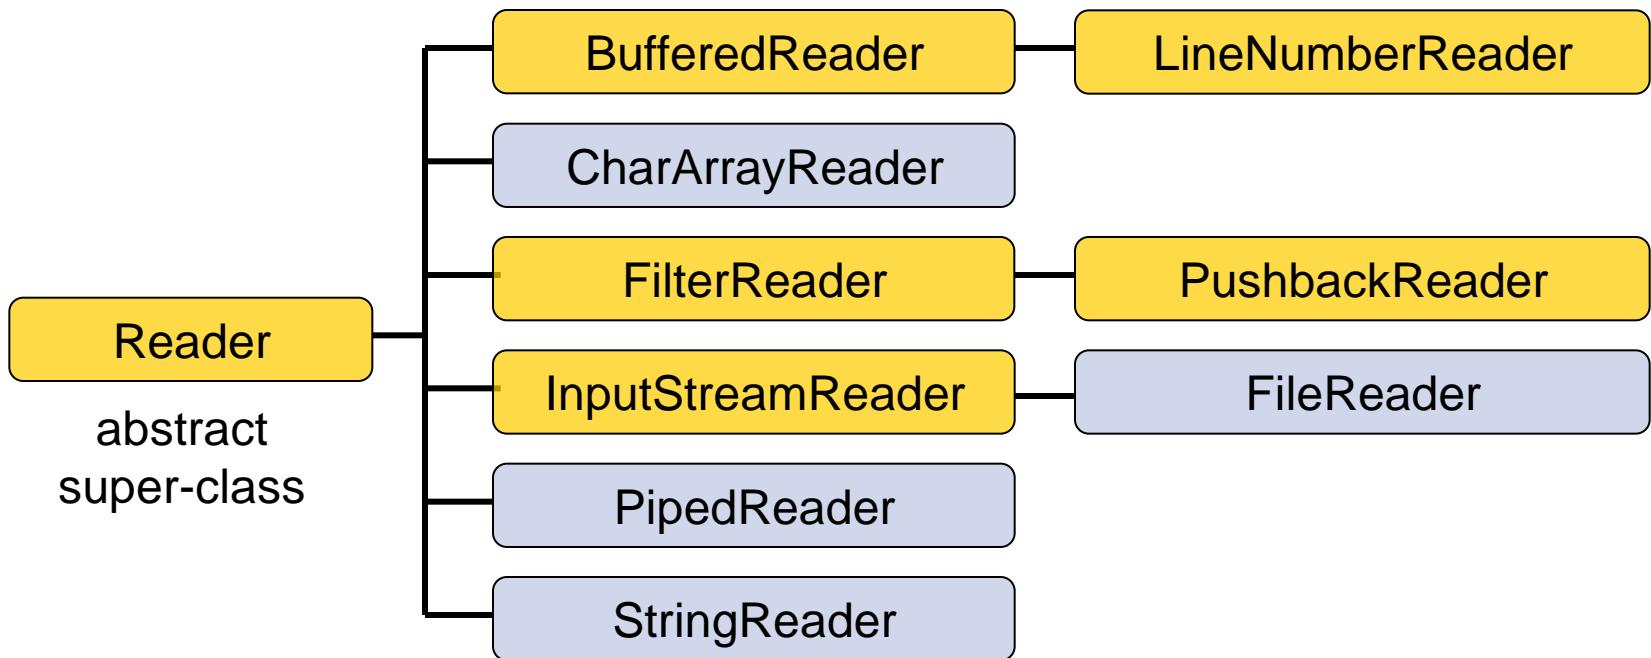

- - read from data sinks
- - perform some processing

# OutputStreams

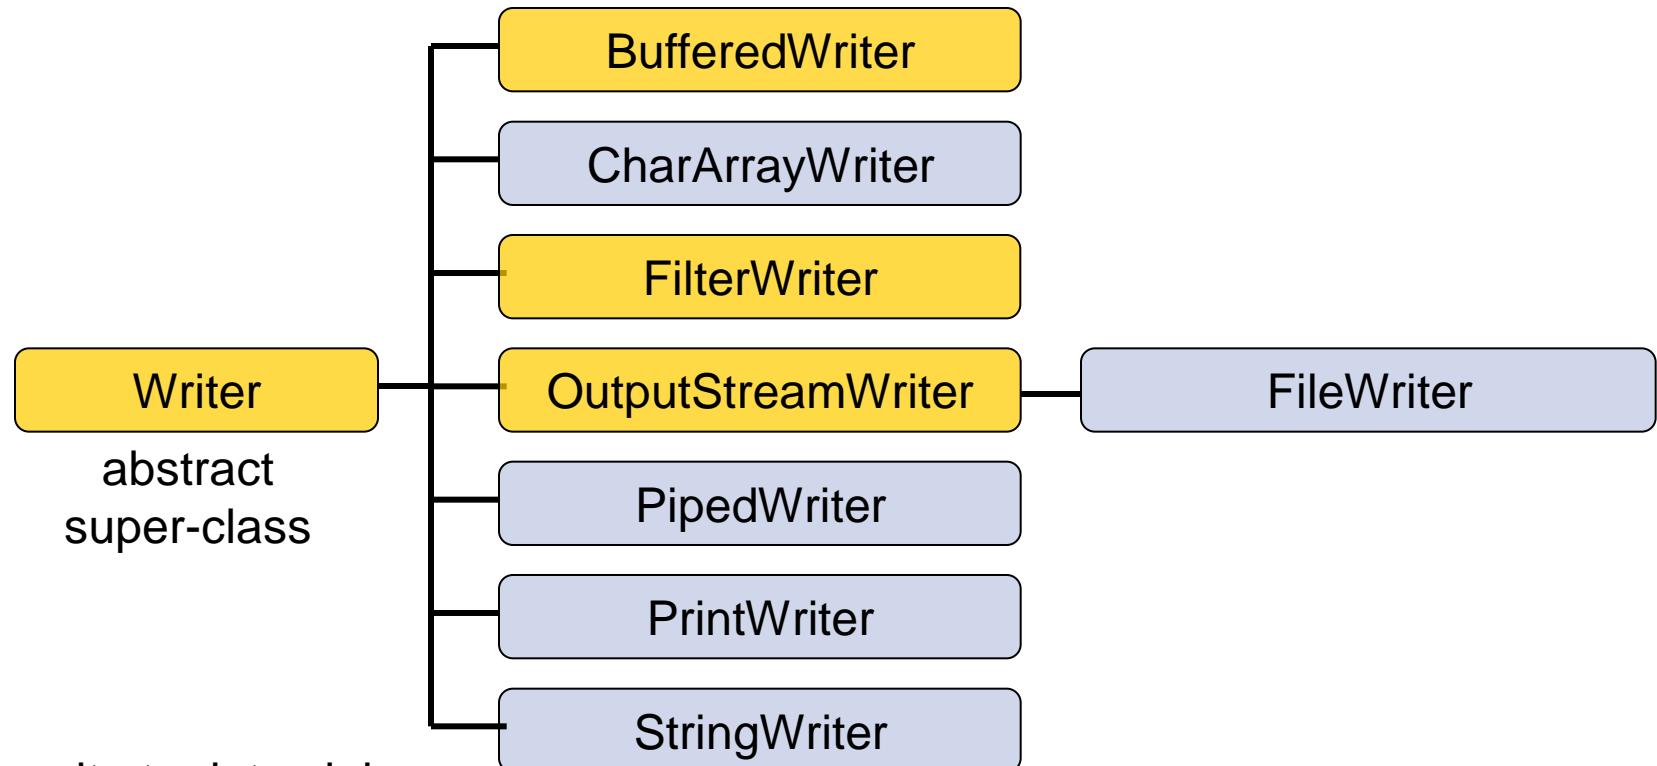

- - write to data sinks
- - perform some processing

# Readers

- - read from data sinks
- - perform some processing

# Writers

- - write to data sinks
- - perform some processing

# Terminal I/O

---

- The `System` class provides references to the standard input, output and error streams:

```
InputStream stdin = System.in;
```

```
PrintStream stdout = System.out;
```

```
PrintStream stderr = System.err;
```

# InputStream Example

- Reading a single byte from the standard input stream:

```
try {  
    int value = System.in.read();  
    ...  
} catch (IOException e) {  
    ...  
}
```

an int with a byte information

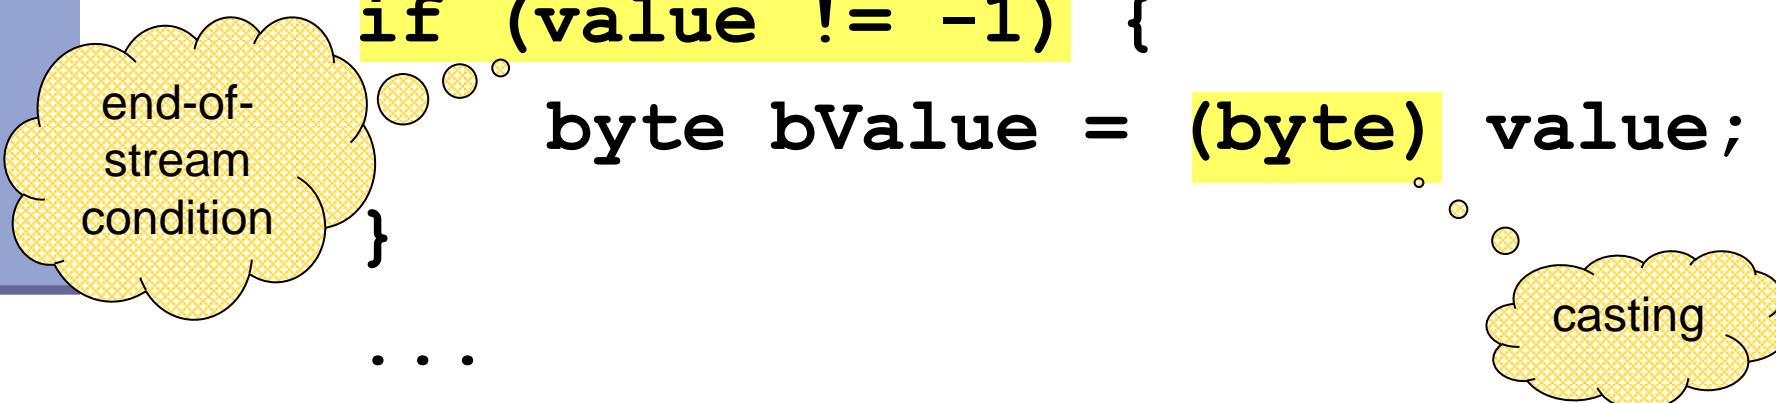

is thrown in case of an error

returns -1 if a normal end of stream has been reached

# InputStream Example

## ■ Another implementation:

```
try {  
    int value = System.in.read();  
    if (value != -1) {  
        byte bValue = (byte) value;  
    }  
    ...  
} catch (IOException e) { ... }
```

# Character Stream Example

```
public static void main(String[] args) {  
  
    try {  
        FileReader in = new FileReader("in.txt");  
        FileWriter out = new FileWriter("out.txt");  
  
        int c;  
        while ((c = in.read()) != -1) {  
            out.write(c);  
        }  
  
        in.close();  
        out.close();  
  
    } catch (IOException e) {  
        // Do something  
    }  
}
```

# Stream Wrappers

- Some streams wrap others streams and add new features.
- A wrapper stream accepts another stream in its constructor:

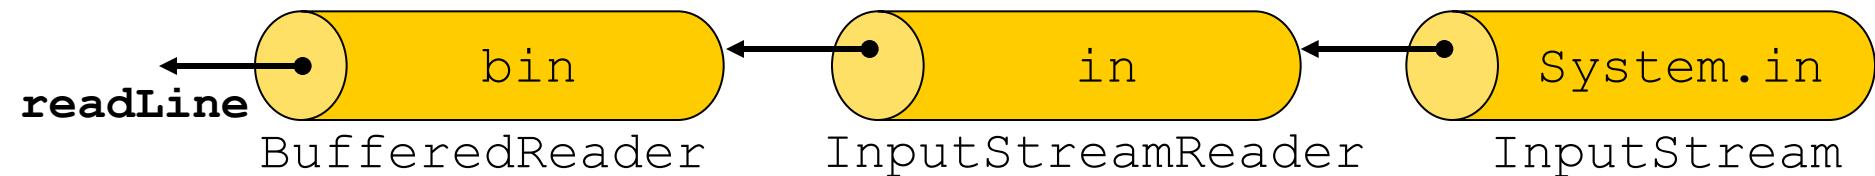

```
DataInputStream din =  
    new DataInputStream(System.in);  
double d = din.readDouble();
```

# Stream Wrappers (cont.)

- Reading a text string from the standard input:

```
try {  
    InputStreamReader in =  
        new InputStreamReader(System.in);  
  
    BufferedReader bin = new BufferedReader(in);  
  
    String text = bin.readLine();  
    ...  
} catch (IOException e) { ... }
```

# The File Class

---

- A utility class for file or directory properties (name, path, permissions, etc.)
- Performs basic file system operations:
  - removes a file: `delete()`
  - creates a new directory: `mkdir()`
  - checks if the file is writable: `canWrite()`
  - creates a new file: `createNewFile()`
- No direct access to file data
- Use file streams for reading and writing

# The File Class

## Constructors

- Using a full pathname:

```
File f = new File("/doc/foo.txt");  
File dir = new File("/doc/tmp");
```

- Using a pathname relative to the current directory defined in user.dir:

```
File f = new File("foo.txt");
```

Note: Use `System.getProperty("user.dir")` to get the value of `user.dir`

(Usually the default is the current directory of the interpreter. In Eclipse it is the project's directory)

# The File Class

## Constructors (cont)

- File f = new File("/doc", "foo.txt");  
    ↑   ↑  
    directory                file  
    pathname               name
- File dir = new File("/doc");  
File f = new File(dir, "foo.txt");
- A File object can be created for a non-existing file or directory
  - Use exists() to check if the file/dir exists

# The File Class

## Pathnames

- Pathnames are system-dependent
  - "/doc/foo.txt" (UNIX format)
  - "D:\doc\foo.txt" (Windows format)
- On Windows platform Java accepts path names either with '/' or '\'
- The system file separator is defined in:
  - File.separator
  - File.separatorChar

# The File Class

## Directory Listing

- Printing all files and directories under a given directory:

```
public static void main(String[] args) {  
    File file = new File(args[0]);  
  
    String[] files = file.list();  
    for (int i=0 ; i< files.length ; i++) {  
        System.out.println(files[i]);  
    }  
}
```

# The File Class

## Directory Listing (cont.)

- Printing all files and directories under a given directory with ".txt" suffix:

```
public static void main(String[] args) {  
    File file = new File(args[0]);  
    FilenameFilter filter = new  
        SuffixFileFilter(".txt");  
  
    String[] files = file.list(filter);  
    for (int i=0 ; i<files.length ; i++) {  
        System.out.println(files[i]);  
    }  
}
```

# The File Class

## Directory Listing (cont.)

```
public class SuffixFileFilter
    implements FilenameFilter {

    private String suffix;

    public SuffixFileFilter(String suffix) {
        this.suffix = suffix;
    }

    public boolean accept(File dir, String name) {
        return name.endsWith(suffix);
    }
}
```

# The Scanner Class

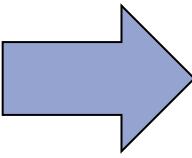

- Breaks its input into tokens using a delimiter pattern (matches whitespace by default)
- The resulting tokens may then be converted into values

```
try {  
    Scanner s = new Scanner(System.in);  
    int anInt = s.nextInt();  
    float aFloat = s.nextfloat();  
    String aString = s.next();  
    String aLine = s.nextLine();  
  
} catch (IOException e) {  
    // Do something  
}
```

# The Scanner Class

- Works with any type of textual input
- We can change the delimiter and other options
- Another example:

```
String input = "1 fish 2 fish red fish blue fish";
Scanner s = new Scanner(input).useDelimiter("\s*fish\s*");
System.out.println(s.nextInt());
System.out.println(s.nextInt());
System.out.println(s.next());
System.out.println(s.next());
s.close();
```

Regular expression

1  
2  
red  
blue

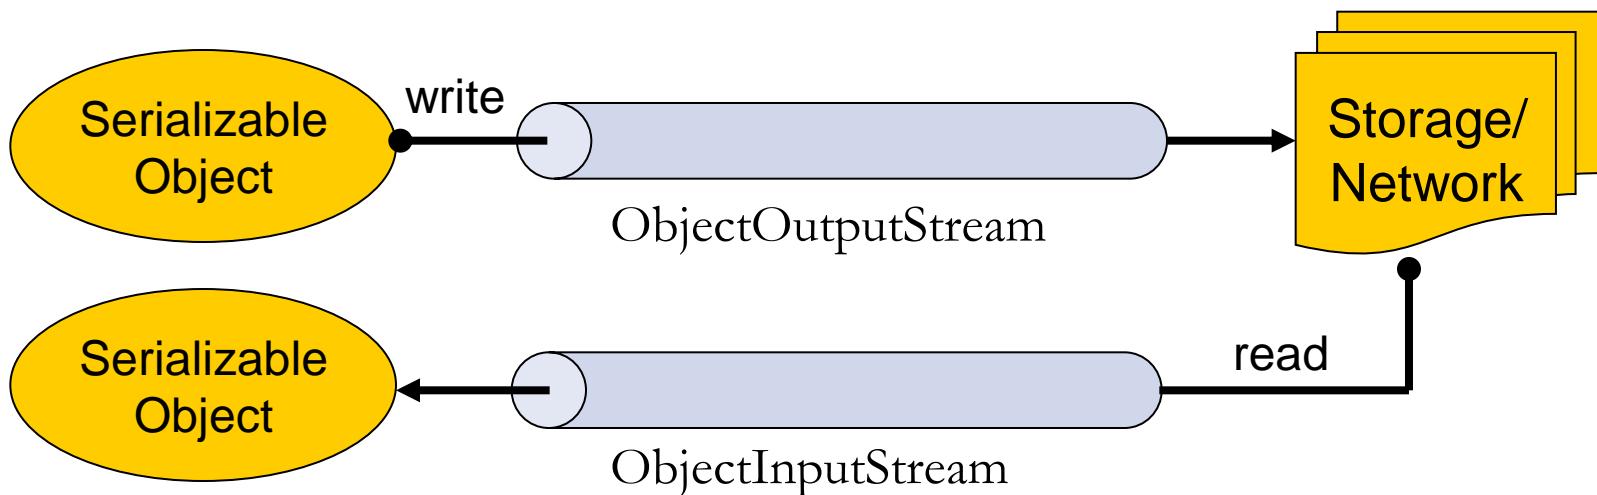

# Object Serialization

---

- A mechanism that enables objects to be:
  - saved and restored from byte streams
  - persistent (outlive the current process)
  
- Useful for:
  - persistent storage
  - sending an object to a remote computer

# The Default Mechanism

- The default mechanism includes:
  - The Serializable interface
  - The ObjectOutputStream
  - The ObjectInputStream

# The Serializable Interface

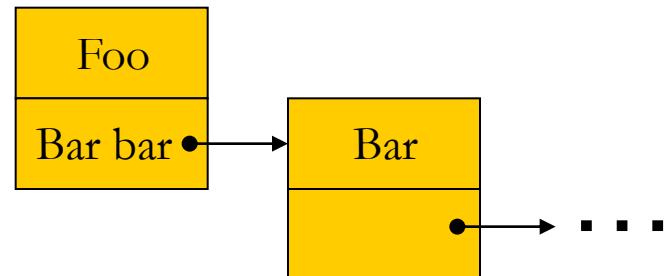

---

- Objects to be serialized must implement the `java.io.Serializable` interface
- An empty interface
- Most objects are Serializable:
  - Primitives, Strings, GUI components etc.
- Subclasses of Serializable classes are also Serializable

# Recursive Serialization

- Can we serialize a Foo object?

```
public class Foo implements Serializable {  
    private Bar bar;  
    ...  
}  
  
public class Bar { ... }
```

- No, since Bar is not Serializable
- Solution:
  - Implement Bar as Serializable
  - Mark the bar field of Foo as transient

# Writing Objects

- Writing a **HashMap** object (**map**) to a file\*:

```
try {  
  
    FileOutputStream fileOut =  
        new FileOutputStream("map.s");  
  
    ObjectOutputStream out =  
        new ObjectOutputStream(fileOut);  
  
    out.writeObject(map);  
  
} catch (Exception e) { . . . }
```

\* **HashMap** is **Serializable**

# Reading Objects

---

```
try {  
  
    FileInputStream fileIn =  
        new FileInputStream("map.s");  
  
    ObjectInputStream in =  
        new ObjectInputStream(fileIn);  
  
    Map h = (Map)in.readObject();  
  
} catch (Exception e) {...}
```

# Instance vs. Class (static) Fields

Instance fields	Class (static) fields
<p>למה?</p> <ul style="list-style-type: none"><li>■ יציג פנימי של המופע</li></ul>	<p>למה?</p> <ul style="list-style-type: none"><li>■ קבועים</li><li>■ ערכיים המשותפים לכל מופעי המחלקה</li></ul>
