## Ray Casting

Image RayCast(Camera camera, Scene scene, int width, int height) \{

Image image = new Image(width, height); for (int $\mathrm{i}=0$; $\mathrm{i}<$ width; $\mathrm{i}++$ ) \{ for (int $\mathrm{j}=0 ; \mathrm{j}<$ height $; \mathrm{j}++$ ) $\{$ Ray ray $=$ ConstructRayThroughPixel(camera, $\mathrm{i}, \mathrm{j}$ ); Intersection hit = FindIntersection(ray, scene); image[i][j] = GetColor(scene, ray, hit); \} \} return image; \}

Wireframe

## Ray Casting

Image RayCast(Camera camera, Scene scene, int width, int height) \{

Image image = new Image(width, height); for (int i $=0$; $\mathrm{i}<$ width; $\mathrm{i}++$ ) \{ for (int $\mathrm{j}=0 ; \mathrm{j}$ < height; $\mathrm{j}++$ ) $\{$ Ray ray $=$ ConstructRayThroughPixel(camera, $\mathrm{i}, \mathrm{j}$ ); Intersection hit = FindIntersection(ray, scene); image[i][j] = GetColor(scene, ray, hit); \} \}
return image;

## Ray Casting

Image RayCast(Camera camera, Scene scene, int width, int height) \{

Image image = new Image(width, height); for (int $\mathrm{i}=0$; $\mathrm{i}<$ width; $\mathrm{i}++$ ) \{ for (int $\mathrm{j}=0 ; \mathrm{j}<$ height $; \mathrm{j}++$ ) $\{$ Ray ray $=$ ConstructRayThroughPixel(camera, $\mathrm{i}, \mathrm{j}$ ); Intersection hit = FindIntersection(ray, scene); image[i][j] = GetColor(scene, ray, hit);
\}
\}
return image;

With Illumination

## Illumination

- How do we compute radiance for a sample ray?
image $[\mathrm{i}][\mathrm{j}]=$ GetColor(scene, ray, hit);

## Goal

- Must derive computer models for ...
- Emission at light sources
- Scattering at surfaces
- Reception at the camera
- Desirable features
- Concise
- Efficient to compute
- "Accurate"

## Overview

- Direct Illumination
- Emission at light sources
- Scattering at surfaces
- Global illumination
- Shadows
- Refractions
- Inter-object reflections

Shadows

Direct Illumination

## Modeling Light Sources

- $I_{L}(x, y, z, \theta, \phi, \lambda) \ldots$
- describes the intensity of energy,
- leaving a light source, ...
- arriving at location( $(x, y, z), \ldots$
- from direction $(\theta, \phi), \ldots$
- with wavelength $\lambda$

Light

## Empirical Models

- Ideally measure irradiant energy for "all" situations
- Too much storage
- Difficult in practice

## OpenGL Light Source Models

- Simple mathematical models:
- Point light
- Directional light
- Spot light

## Point Light Source

- Models omni-directional point source (e.g., bulb)
- intensity ( $\mathrm{I}_{0}$ ),
- position (px, py, pz),
- factors $\left(k_{c}, k_{1}, k_{q}\right)$ for attenuation with distance (d)

$$
I_{L}=\frac{\mathrm{I}_{0}}{\mathrm{k}_{\mathrm{c}}+\mathrm{k}_{1} d+\mathrm{k}_{\mathrm{q}} d^{2}}
$$

Light

## Directional Light Source

- Models point light source at infinity (e.g., sun)
- intensity ( $\mathrm{I}_{0}$ ),
- direction (dx,dy,dz)
(dx, dy, dz)

No attenuation with distance

$$
I_{L}=I_{0}
$$

## Spot Light Source

- Models point light source with direction (e.g., Luxo)
- intensity ( $I_{0}$ ),
- position (px, py, pz),
- direction $\mathrm{D}=(\mathrm{dx}, \mathrm{dy}, \mathrm{dz})$
- attenuation

Light

$$
I_{L}=\frac{\mathrm{I}_{0}(D \bullet L)}{\mathrm{k}_{\mathrm{c}}+\mathrm{k}_{1} d+\mathrm{k}_{\mathrm{q}} d^{2}}
$$

## Overview

- Direct Illumination
- Emission at light sources
- Scattering at surfaces
- Global illumination
- Shadows
- Refractions
- Inter-object reflections

Direct Illumination

## Modeling Surface Reflectance

- $\mathrm{R}_{\mathrm{s}}(\theta, \phi, \gamma, \psi, \lambda)$...
- describes the amount of incident energy,
- arriving from direction $(\theta, \phi), \ldots$
- leaving in direction $(\gamma, \psi), \ldots$
- with wavelength $\lambda$

## Surface

## Empirical Models

- Ideally measure radiant energy for "all" combinations of incident angles
- Too much storage
- Difficult in practice

Surface

## Empirical Models

- Example: BRDF (Bidirectional reflectance distribution function)
- 4-dimensional function which defines light reflection at an opaque surface.

$$
f_{r}\left(w_{i}, w_{o}\right)=\frac{d L_{r}\left(w_{0}\right)}{d E_{i}\left(w_{i}\right)}=\frac{d L_{r}\left(w_{0}\right)}{L_{i}\left(w_{i}\right) \cos \left(\theta_{i}\right) d w_{i}}
$$

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Based on model proposed by Phong in his PhD dissertation 1973

## Diffuse Reflection

- Diffuse: Spread Out / To pass by spreading every way / To extend in all directions
- Assume surface reflects equally in all directions
- Examples: chalk, clay

## Diffuse Reflection

- How much light is reflected?
- Depends on angle of incident light

$$
d L=d A \cos \Theta
$$

## Diffuse Reflection

- Lambertian model
- cosine law (dot product)

$$
\begin{aligned}
& N \cdot L=|N||L| \cos \Theta \\
& \hat{N} \cdot \hat{L}=\cos \Theta \\
& I_{D}=K_{D}(\hat{N} \cdot \hat{L}) I_{L}
\end{aligned}
$$

Surface

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

## Surface

## Specular Reflection

- Reflection is strongest near mirror angle
- Examples: mirrors, metals

## Specular Reflection

- How much light is seen?
- Depends on angle of incident light and angle to viewer

Viewer

## Specular Reflection

- Phong Model
${ }^{\circ} \cos (\alpha)^{n}$
Phong exponent: apparent smoothness of the surface

Viewer

## Specular Reflection

- Phong Examples

Direction of light source and shininess exponent is varied

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Surface

## Emission

- Represents light emanating directly from polygon

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Surface

## Ambient Term

- Represents reflection of all indirect illumination

This is a total hack (avoids complexity of global illumination)!

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Surface

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

## Surface Illumination Calculation

- Single light source:

## Surface Illumination Calculation

- Multiple light sources:

$$
I=I_{E}+K_{A} I_{A L}+\sum_{i}\left(K_{D}\left(N \bullet L_{i}\right) I_{i}+K_{S}\left(V \bullet R_{i}\right)^{n} I_{i}\right)
$$

## Overview

- Direct Illumination
- Emission at light sources
- Scattering at surfaces
- Global illumination
- Shadows
- Transmissions
- Inter-object reflections

Global Illumination

## Global Illumination

"Balanza" © Jaime Vives Piqueres (2002)

## Shadows

- Shadow terms tell which light sources are blocked
- Cast ray towards each light source $\mathrm{L}_{\mathrm{i}}$
- $S_{i}=0$ if ray is blocked, $S_{i}=1$ otherwise

## Ray Casting

- Trace primary rays from camera
- Direct illumination from unblocked lights only

$$
I=I_{E}+K_{A} I_{A}+\sum_{L}\left(K_{D}(N \bullet L)+K_{S}(V \bullet R)^{n}\right) S_{L} I_{L}
$$

## Recursive Ray Tracing

- Also trace secondary rays from hit surfaces
- Global illumination from mirror reflection and transparency

$$
I=I_{E}+K_{A} I_{A}+\sum_{L}\left(K_{D}(N \bullet L)+K_{S}(V \bullet R)^{n}\right) S_{L} I_{L}+K_{S} I_{R}+K_{T} I_{T}
$$

## Mirror reflections

- Trace secondary ray in direction of mirror reflection
- Evaluate radiance along secondary ray and include it into illumination model

## Transparency

- Trace secondary ray in direction of refraction
- Evaluate radiance along secondary ray and include it into illumination model

## Transparency

- Transparency coefficient is fraction transmitted
- $\mathrm{K}_{\mathrm{T}}=1$ if object is translucent, $\mathrm{K}_{\mathrm{T}}=0$ if object is opaque
- $0<K_{T}<$ lif object is semi-translucent

## Refractive Transparency

- For thin surfaces, can ignore change in direction
- Assume light travels straight through surface

## Refractive Transparency

For solid objects, apply Snell's law:
$\eta_{r} \sin \Theta_{r}=\eta_{i} \sin \Theta_{i}$

$$
T=\left(\frac{\eta_{i}}{\eta_{r}} \cos \Theta_{i}-\cos \Theta_{r}\right) N-\frac{\eta_{i}}{\eta_{r}} L
$$

## Recursive Ray Tracing

- Ray tree represents illumination computation

Ray traced through scene

Ray tree

$$
I=I_{E}+K_{A} I_{A}+\sum_{L}\left(K_{D}(N \bullet L)+K_{S}(V \bullet R)^{n}\right) S_{L} I_{L}+K_{S} I_{R}+K_{T} I_{T}
$$

## Recursive Ray Tracing

- Ray tree represents illumination computation

Ray traced through scene

Ray tree

$$
I=I_{E}+K_{A} I_{A}+\sum_{L}\left(K_{D}(N \bullet L)+K_{S}(V \bullet R)^{n}\right) S_{L} I_{L}+K_{S} I_{R}+K_{T} I_{T}
$$

## Recursive Ray Tracing

- GetColor calls RayTrace recursively

```
Image RayTrace(Camera camera, Scene scene, int width, int height)
{
    Image image = new Image(width, height);
    for (int i = 0; i < width; i++) {
    for (int j = 0; j < height; j++) {
        Ray ray = ConstructRayThroughPixel(camera, i, j);
        Intersection hit = FindIntersection(ray, scene);
        image[i][j] = GetColor(scene, ray, hit);
    }
}
return image;
}
```

## Summary

- Ray casting (direct Illumination)
- Usually use simple analytic approximations for light source emission and surface reflectance
- Recursive ray tracing (global illumination)
- Incorporate shadows, mirror reflections, and pure refractions

All of this is an approximation so that it is practical to compute

More on global illumination later!

## Illumination Terminology

- Radiant power [flux] ( $\Phi$ )
- Rate at which light energy is transmitted (in Watts).
- Radiant Intensity (I)
- Power radiated onto a unit solid angle in direction (in Watts/sr)
- Radiance (L)
- Radiant intensity per unit projected surface area (in Watts/m²sr)
- Irradiance (E)
- Incident flux density on a locally planar area (in Watts/m²)
- Radiosity (B)
- Exitant flux density from a locally planar area (in Watts/ m² )
