Advanced Java Programming Swing

Eran Werner, Tel-Aviv University Summer, 2005

19 May 2005

Advanced Java Programming, Summer 2005

Introduction to Swing

The Swing package is part of the Java Foundation Classes (JFC), a group of features for GUI design.

Other JFC features are Accessibility API, Java 2D API, Drag-and-Drop Support and Internationalization.

19 May 2005

Advanced Java Programming, Summer 2005

Swing libraries

All Swing components are under javax.swing.*

Since Swing uses the AWT event model, we need to add the following in order to use events:

- java.awt.*
- Java.awt.event.*

19 May 2005

Advanced Java Programming, Summer 2005

Swing vs. AWT

Almost every AWT component has a corresponding Swing component with a 'J' prefix (Button \rightarrow JButton, Panel \rightarrow JPanel).

19 May 2005

Advanced Java Programming, Summer 2005

Swing Vs. AWT

Lightweight components, platform independent.

java.lang.Object java.awt.Component java.awt,Container AWT components (Label, Button, Choice, List...) Window **JComponent** Paņel Frame Applet JLabel JFrame JApplet JTextField JComboBox JCheckBox JPanel

19 May 2005 Advanced Java Programming, Summer 2005

Swing Vs. AWT

The main difference between AWT and Swing components is that swing components are implemented with absolutely no native code.

Swing components aren't restricted to the features presented in every platform and therefore can have more functionality.

19 May 2005

Advanced Java Programming, Summer 2005

Swing Vs. AWT

Swing Buttons and labels can display images as well as text.

You can add or change the borders for swing components.

You can easily change the behavior or a swing component by subclassing it or invoking its methods

19 May 2005

Advanced Java Programming, Summer 2005

Swing Vs. AWT

Swing components do not have to be rectangular, since they can be transparent. Buttons for example can be round.

The Swing API allows you to specify which look and feel to use, in contrast to AWT where the native platform look and feel is always used.

19 May 2005

Advanced Java Programming, Summer 2005

Swing Vs. AWT

Swing components use models to keep the state. A Jslider uses BoundedRangeModel. A JTable uses a TableModel.

Models are set up automatically so you don't have to bother them unless you want to take advantage of them.

19 May 2005

Advanced Java Programming, Summer 2005

Top-level container

Every program with a Swing GUI must have at least one top-level container.

There are three top-level containers:

- **JFrame**: a main window
- JDialog: a secondary window, dependent on another window.
- Japplet: An applet display area within a browser window.

19 May 2005

Advanced Java Programming, Summer 2005

JFrame

Setting up a frame:

JFrame frame = new JFrame("HelloWorldSwing");

// ... Add components to the frame

frame.setVisible(true);

Adding a component to a frame:

frame.getContentPane().add(label);

Closing a frame:

frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);

19 May 2005

Advanced Java Programming, Summer 2005

JLabel

- A component that displays text.
- Can also display an image.
- Does not react to input events.
- Cannot get the keyboard focus.

JLabel label = new JLabel("Hello World"); frame.getContentPane().add(label);

19 May 2005

Advanced Java Programming, Summer 2005

The JComponent Class

All Swing components whose names begin with "J" descend from the JComponent (except JFrame and JDialog - top level containers).

For example, JPanel, JScrollPane, JButton, and JTable.

JComponent extends java.awt.Container

19 May 2005

Advanced Java Programming, Summer 2005

13

The JComponent Class

JComponent Features

- Tool tips
- Painting and borders
- Application-wide pluggable look and feel
- Support for drag and drop
- Double buffering
- Key bindings

19 May 2005

Advanced Java Programming, Summer 2005

Advanced Java Programming, Summer 2005

Look and Feel

Java (cross-platform) look and feel

CDE/Motif look and feel

Windows look and feel

Specifying look and feel

UIManager.setLookAndFeel(

UIManager.getCrossPlatformLookAndFeelClassName());

Dynamic text Creating a button The mnemonic functions as a hot key. The event handler updates the label's text when the button is clicked. JButton button = new JButton("I'm a Swing button!"); button.setMnemonic('i'); button.addActionListener(new ActionListener() { public void actionPerformed(ActionEvent e) { numClicks++; label.setText(labelPrefix + numClicks); } }); J9 May 2005 Advanced Java Programming, Summer 2005

Borders

Every JComponent can have one or more borders.

Borders are incredibly useful objects that, while not themselves components, know how to draw the edges of Swing components.

19 May 2005	
-------------	--

Advanced Java Programming, Summer 2005

Borders

To put a border around a JComponent, you use its setBorder method. You can use the BorderFactory class to create most of the borders that Swing provides.

19 May 2005

Advanced Java Programming, Summer 2005

Example 2: Celsius Converter

Topics:

- •The JTextField component.
- •The default button.
- Adding HTML.
- •Icons.

19 May 2005

Advanced Java Programming, Summer 2005

JTextField

Allows the editing of a single line of text.

Fires TextEvents when changed (notifies a TextListener).

JTextField temprature = new JTextField(5);

The argument 5 together with the current font determines the preferred size of the text field. This argument has no effect on the amount of characters that can be typed.

Event handler for the "convert" button:

public void actionPerformed(ActionEvent event) {
 int newTemp =
 (int)((Double.parseDouble(temprature.getText()))
 * 1.8 + 32);
 fahrenheitLabel.setText(newTemp + " Fahrenheit");
}

19 May 200

Advanced Java Programming, Summer 2005

21

,	7

The default button

At most one button in a top-level container can be the default button.

The default button is highlighted and acts clicked when the user presses enter.

Useful in Dialog windows.

The default button is set in the following way (assuming we are in the constructor of a top-level container):

getRootPane().setDefaultButton(setButton);

19 May 2005

Advanced Java Programming, Summer 2005

22

Adding HTML

To add HTML to a component, use the html.../html> tag. HTML is useful for controlling fonts, colors, line breaks, etc.

breaks, etc.

19 May 2005

Advanced Java Programming, Summer 2005

23

100° Fahrenheit

Icons

An icon usually refers to a descriptive fixed-size image.

Some components can be decorated with an icon.

Swing provides an interface called Icon.

It also provides a useful implementation of this interface: ImageIcon.

19 May 2005

Advanced Java Programming, Summer 2005

(2	,
Ò	5)

Icons

ImageIcon constructs an icon from a GIF or JPEG image.

The following code adds the arrow icon to the "convert" button:

ImageIcon icon = new ImageIcon("images/convert.gif", JButton convertButton = new JButton(icon);

Advanced Java Programming, Summer 2005

Example 3: Lunar Phases

- •The JPanel component.
- •Compound borders.
- The JComboBox component.
- •Using multiple images.

19 May 2005

Advanced Java Programming, Summer 2005

JPanel

A general-purpose container (without a window).

A panel is opaque by default.

To make it transparent, use setOpaque(false).

A transparent panel has no background (components under it show through).

The Lunar Phase example uses several panels:

selectPanel = new JPanel();
displayPanel = new JPanel();

displayPanel = new JPanel();
mainPanel = new JPanel();
mainPanel.setLayout(new GridLayout(2,1,5,5));
mainPanel.setBorder(BorderFactory.createEmptyBorder(5,5,5,5));
mainPanel.add(selectPanel); // using the default FlowLayout
mainPanel.add(displayPanel);

19 May 2005

Advanced Java Programming, Summer 2005

Compound borders

It is possible to set more than one border to a component. we can specify an outer and inner borders by BorderFactory.createCompoundBorder

selectPanel.setBorder(BorderFactory.createCompoundBorder(
BorderFactory.createTitledBorder("Select Phase"),
BorderFactory.createEmptyBorder(5,5,5,5)));

The titled border adds a title and a border line to the component.

The empty border in this case adds a space between the titled border and the inner components.

19 May 2005

Advanced Java Programming, Summer 2005

JComboBox

A component that enables user choice.

Can be editable allowing to dynamically add choices.

Constructed with an array of Strings. Icons can also be added.

An initial item can be selected using the setSelectedIndex method.

The selection is done by the item index.

When the user starts writing an item the selection changes accordingly.

19 May 2005

Advanced Java Programming, Summer 2005

29

JComboBox

An event handler for ${\tt ActionEvents}$ fired from a combo box.

```
public void actionPerformed(ActionEvent event) {
   if ("comboBoxChanged".
        equals(event.getActionCommand()))
     phaseIconLabel.setIcon(
        images[phaseChoices.getSelectedIndex()]);
   }
}
```

19 May 2005

Advanced Java Programming, Summer 2005

Using multiple images

In the Lunar Phase example, we have a "bank" of 8 images, but display only one at a time.

We can choose whether to load all images in advance, or to load a single image when it is required ("lazy image loading").

19 May 2005

Advanced Java Programming, Summer 2005

31

Loading Images

The following code loads the images in advance:

ImageIcon[] images = new ImageIcon[NUM_IMAGES];
for (int i = 0; i < NUM_IMAGES; i++) {
 String imageName = "images/image" + i + ".jpg";
 URL iconURL = ClassLoader.getSystemResource(imageName);
 images[i] = new ImageIcon(iconURL);</pre>

ClassLoader.getSystemResource(imageName) searches for the image file in the classpath.

A URL object with the file's location is returned.

This way, we don't have to specify the full path of the images.

19 May 2005

Advanced Java Programming, Summer 2005

32

Example 4: Vote Dialog

Topics:

• The JRadioButton component.

- Dialogs.
 - Displaying and customizing dialogs.
 - Receiving user input from a dialog.

19 May 2005

Advanced Java Programming, Summer 2005

JRadioButton

An item that can be selected or deselected.

For each group of radio buttons, you need to create a ButtonGroup instance and add each radio button to it.

ButtonGroup takes care of unselecting the previously selected button when the user selects another one in the group.

19 May 200

Advanced Java Programming, Summer 2005

3/1

JRadioButton

JRadioButton[] radioButtons = new JRadioButton[numButtons]; ButtonGroup group = new ButtonGroup();

for (int i = 0; i < numButtons; i++)
 group.add(radioButtons[i]);
radioButtons[0].setSelected(true);</pre>

19 May 2005

Advanced Java Programming, Summer 2005

35

Dialogs

A top-level window with a title and a border. used to get some input from the user.

Must have a frame or another dialog as its "owner".

- When the owner is destroyed, so is the dialog.
- When the owner is minimized, so is the dialog.

Can be modal (disables all input to other toplevel windows).

Can be used to create a custom dialog (many ready made dialogs are available in JOptionPane).

19 May 2005

Advanced Java Programming, Summer 2005

1	1
1	_

JOptionPane

Enables creation and customization of several kinds of modal dialogs.

Dialogs are created by invoking one of the static creation methods in JOptionPane

Customization options:

- Choosing an icon.
- Setting the title and text.

19 May 2005

Advanced Java Programming, Summer 2005

showMessageDialog

Displays a modal dialog with one button labeled "ok".

The title, text and icon are customizable.

JOptionPane.showMessageDialog (frame,"This candidate is a dog. " + "Invalid vote.");

19 May 2005

Advanced Java Programming, Summer 2005

showOptionDialog

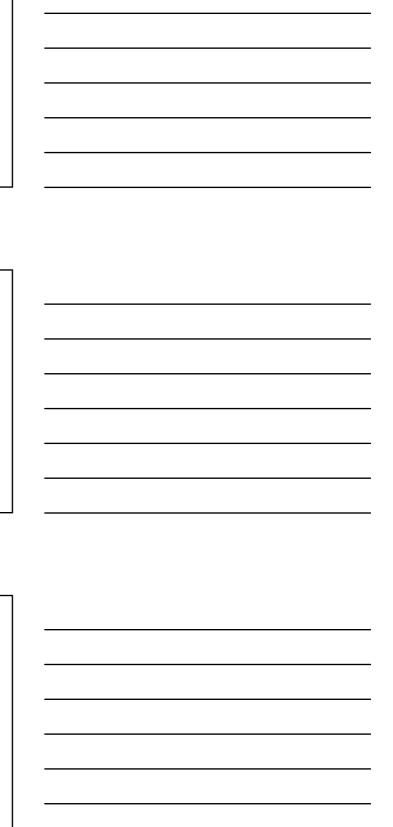

Displays a modal dialog with specified buttons, title, text and icon.

// the owner frame // message text // title // button format // message type // custom icon // button names // default select:

19 May 2005

Advanced Java Programming, Summer 2005

User input from a dialog

The showMessageDialog and showOptionDialog methods both return an integer indicating the user's choice.

The possible returned values are:

- YES_OPTION
- NO_OPTION
- CANCEL_OPTION
- OK_OPTION
- CLOSED_OPTION (dialog closed without clicking a button)

The value is returned according to the clicked button and the button format of the dialog (DEFAULT, YES_NO, YES_NO_CANCEL, OK).

The buttons' text doesn't affect the returned value.

10 May 200

Advanced Java Programming, Summer 2005

40

Swing components

The rest of this presentation contains a short description of most Swing components:

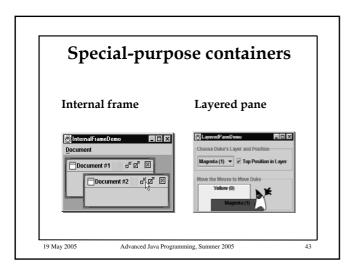

- General-purpose containers.
- Special-purpose containers.
- Basic controls.
- Uneditable information displays.
- Editable displays of formatted information.

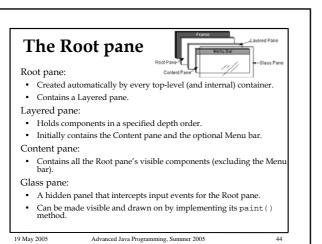

19 May 2005

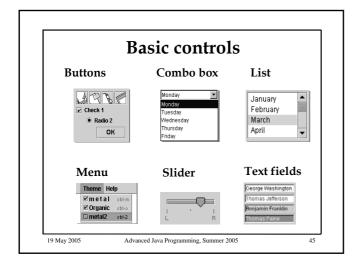

Advanced Java Programming, Summer 2005

41

General-purpose containers Panel Scroll pane Split pane Tabbed pane File Ogtions Com Split pane File Ogtions Com Split

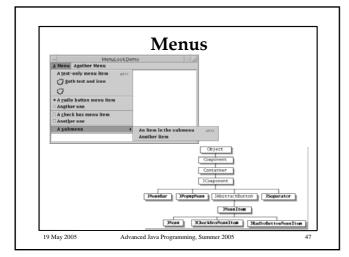

Buttons

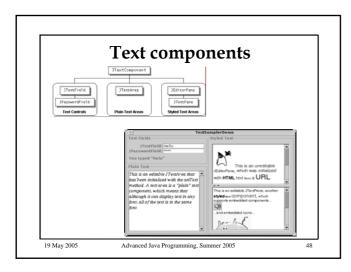

The following list contains all button types (all are subclasses of AbstractButton):

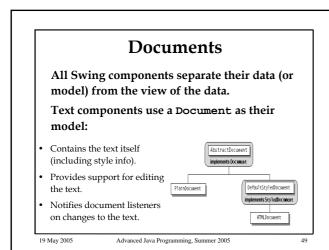

- **JButton**: a common button.
- JCheckBox: a check box button.
- JRadioButton: one of a group of radio buttons.
- JMenuItem: an item in a menu.
- JCheckBoxMenuItem: a menu item that has a check box.
- JRadioButtonMenuItem: a menu item that has a radio button.
- JToggleButton: a two-state button.

19 May 2005

Advanced Java Programming, Summer 2005

Editor kits

Each text component holds an editor kit:

- Manages editing actions (cut, paste, etc) for the text component.
- Reads and writes documents of a particular format.

DefaultEditorKit:

- Reads and writes plain text.
- Provides a basic set of editing commands.
- The super class of all other editor kits.

StyledEditorKit:

- Reads and writes styled text.
- Provides editing commands for styled text.

HTMLEditorKit:

- Reads, writes and edits HTML.
- Subclass of StyledEditorKit.

GUI events **Examples of Events and Their Associated Event Listeners** Action that Results in the Event Listener Type •Clicking a button $\bullet \textbf{Pressing enter while typing in a text field } \\$ ActionListener •Choosing a menu item •Closing a frame (main window) WindowListener \bullet Clicking a mouse button while the cursor MouseListener is over a component •Moving the mouse over a component MouseMotionListener $\bullet \textbf{Component becomes visible} \\$ ComponentListener •Component gets the keyboard focus FocusListener • Table or list selection changes ListSelectionListener 19 May 2005 Advanced Java Programming, Summer 2005 53

Converting AWT to Swing

- •java.awt.* → javax.swing.*
- •in applets, change java.applet.Applet \rightarrow JApplet.
- •Replace components (e.g. Button → JButton).
- $\bullet frame.add(...) \Rightarrow frame.getContentPane().add(...).$
- The same for setLayout(...).
- \bullet Put custom painting code in paintComponent(...) instead of paint() and update().
- Custom painting in a top-level container is not visible in Swing (the painting is hidden by the content pane). Transfer the painting to another component.
- •Thread safety issues: AWT is thread safety, while Swing is not.

19 May 2005 Advanced Java Programming, Summer 2005 54

Converting AWT to Swing

The containment hierarchy for any window or applet containing swing components must have a swing top level container at the root of the hierarchy. For example the main window should be a JFrame rather than a Frame.

Advanced Java Programming, Summer 2005

--

Thread safety: the problems

Swing GUI components are updated in an event dispatching mechanism

In Swing, once a component is created, it can be updated only through the event dispatching mechanism.

Problem 1: What happens if we want to update the GUI from another thread?

19 May 2005

Advanced Java Programming, Summer 2005

56

Thread safety: the problems

Problem2: when a button is clicked, the following actions occur one after the other:

- The button's GUI is drawn as 'pressed'
- The button's listeners are notified on the press.
- The button's GUI is drawn as 'released'

Suppose that one of the listeners changes the appearance of the button.

When all listeners finished, the button is redrawn (as 'released') and the appearance changes may be erased.

19 May 2005

Advanced Java Programming, Summer 2005

Thread safety: the solution

The SwingUtilities class provides two methods that solve the problems:

- **invokeLater**: this method adds some code to the event dispatching queue. This code will be executed in its turn. The code is defined in a Runnable object.
- invokeAndWait: like invokeLater, but this method waits for the code to be executed, and only then it returns.

19 May	2005
