

Dr. Rubi Boim

Motivation (for this course)

SQL is an important "standard"

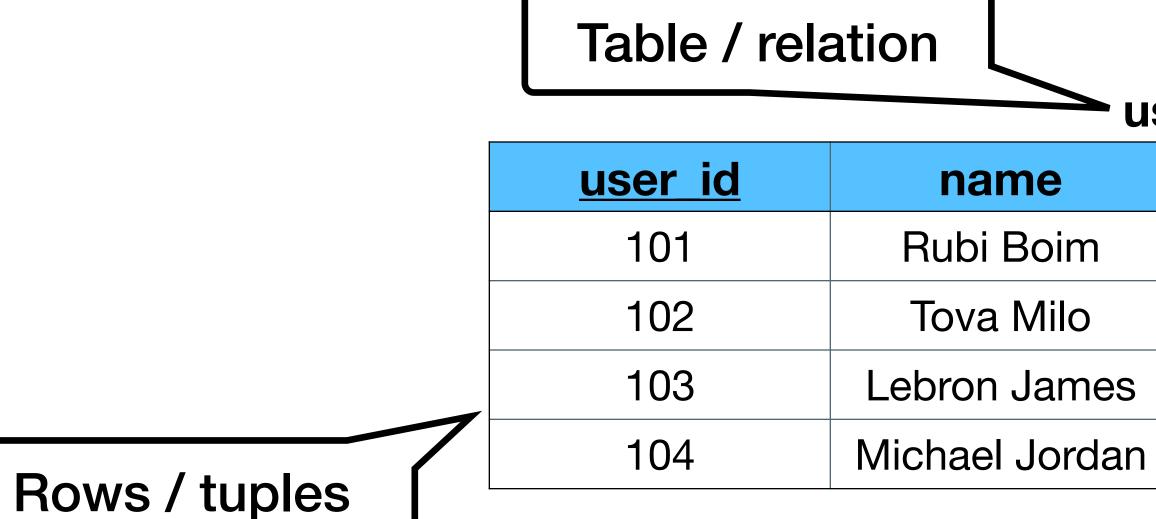

- Used in RDBMS and most Data Warehouses
- But NOT in most NoSQL
 - Each product has its own API
 - BUT some are built on the same building blocks CQL (Cassandra)
- Joins and normalization are crucial for RDBMS

You should know them well as they are <u>anti-patterns</u> for Wide columns

Reminder - relational model

- Data is stored in tables of columns and rows
- A <u>unique key</u> identifies each row
- The table is <u>unordered</u> (no first / last)

Columns / attributes users brithdate city Tel Aviv <null> Tel Aviv <null> 30/12/1984 Los Angeles 17/02/1963 Chicago

Structured Query Language

- An "API" for querying and maintaining the database
- Different standards (ANSI SQL, SQL3...)

Can be classified to

- Data Definition Language (DDL) create / alter / delete tables
- Data Manipulation Language (DML) select / insert / update /delete <u>data</u>

Data Definition Language (DDL)

create / alter / delete tables

(We present here only the basics - there are a lot more options for each operation)

CREATE TABLE

Creates a new table

CREATE TABLE • • •

table(column1 DATATYPE, column2 DATATYPE, column3 DATATYPE,

DATATYPES

. . .

VARCHAR(n), INT, SMALLINT, MEDIUMINT, BIGINT, FLOAT, DOUBLE, DATE, DATETIME, TIMESTAMP, BIT

CREATE TABLE

CREATE TABLE users(user_id INT, name VARCHAR(255), city VARCHAR(255), birthdate DATE

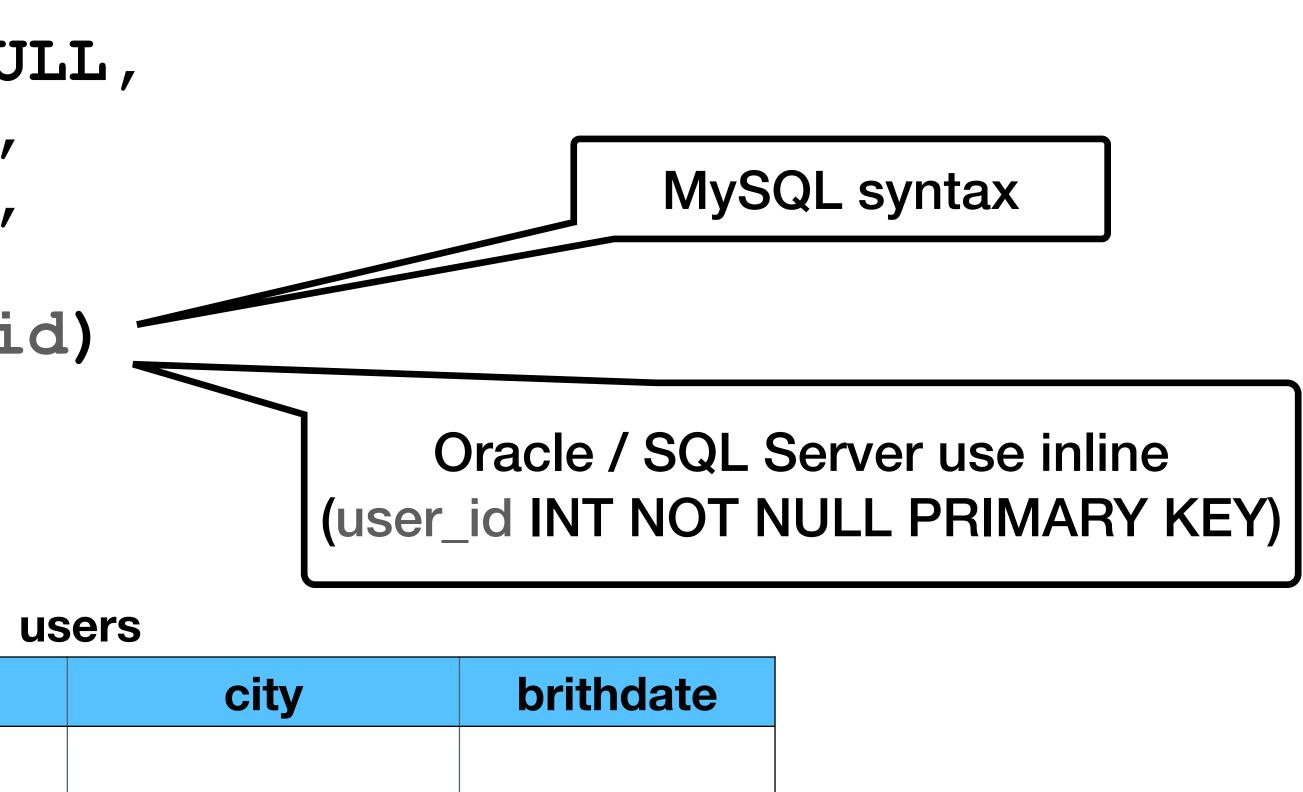

user_id	name	city	brithdate

users

CREATE TABLE

CREATE TABLE users(user_id INT NOT NULL, name VARCHAR(255), city VARCHAR(255), birthdate DATE, PRIMARY KEY(user_id)

<u>user id</u>	name

DROP TABLEDeletes an existing table

DROP TABLE table

Warning - A LOT of data could be delete

ALTER TABLE

Alters an existing table

ALTER TABLE table(ADD column1 DATATYPE, DROP column2, ALTER column3 newName DATATYPE

ALTER TABLE

CREATE TABLE users (user id INT, name VARCHAR(255), city VARCHAR(255), birthdate DATE

ALTER TABLE users (DROP city)

users

user_id	name	city	brithda

users (after alter)

user_id	name	brithdate

Data Manipulation Language (DML)

select / insert / update /delete data

(We present here only the basics - there are a lot more options for each operation)

Retrieves data from the database

SELECT FROM WHERE

attributes tables conditions ORDER BY attributes

Return all users in a descending order
